**Certificate Course in Basics of HIV/AIDS**  
Course out Come 2020-21

Spreading Knowledge and Awareness about HIV is one of the Key Strategies Utilized in the Prevention and Control of HIV/AIDS Worldwide .This Study assesses the Knowledge the Observations of this Study Will Serve as a Basis for Further Tailored Approaches to Strategic Programs to Control this disease.

This Study highlights the awareness among the young about the mode of Transmission of HIV/AIDS. Our Course Underlines the Need to Educate the Public about Prevention of HIV/AIDS.

It was interesting to note that most of the Students of our College Knew that a person having a healthy look might have been infected with HIV .

QI Answer the following question

1. Expand HIV.

Human immunodeficiency virus

2. What is HIV / Aids

HIV is a virus that attacks cells that help the body fight infection making a person more vulnerable to other infection and disease.

3. Mention any two control methods of HIV.

1. Never sharing needles.

2. Using condoms the right way every time you have sex.

4. What is the treatment that a person gets from HIV / Aids

A. P. T. (Antiretroviral therapy)

5. Explain ART test.

Integrated Counseling and Testing Centre (ITCC)

QII Answer the questions.

1) What is the history of HIV / Aids?

In 1983, HIV (Human immunodeficiency virus) was discovered as the virus that causes an Aids. The center for disease control and prevention (CDC) found that HIV Aids was only passed, or transmitted, through contact with blood, semen and fluids from the vagina. It was also found that HIV could be passed from mother

to child during pregnancy or childbirth or by breastfeeding.

2. What is the difference between HIV/AIDS?  
HIV (Human Immunodeficiency Virus) is a virus that only affects human beings. A person develops HIV if the virus gets into his or her bloodstream and begins making more and more of itself, or reproducing. AIDS (Acquired Immune Deficiency Syndrome) is a later stage of HIV disease. According to the CDC, a person living with HIV has AIDS when he (or she) :-> has a very weakened defense system.

3) What should I know about HIV prevention and sex?  
Adolescence is a time of growth from childhood into adulthood as you make this change, you may become more interested in sex. You may also have questions about relationships. It is important to find good sources of information - they might be a health care provider, parent, family member, teacher (or) counselor.

4. What should I know about HIV prevention and substance use?  
Making healthy choices about substance use is important for young people. There are many different drugs or substances that a young person might be exposed to at school, through friends or even at home, these can include things like :-  
-> Alcohol  
-> Marijuana  
-> Ecstasy  
-> Cocaine  
-> Heroin, etc

5. If need to write a school report about HIV/AIDS when can I find information and statistics you can find medical information, Community tracks the number resources and statistics. The health department track the number of cases of HIV it is important to know how many people are living with HIV in different areas. The health department tracks the number of cases of HIV by gender, race, ethnicity and age. A person who studies numbers about health conditions is called an epidemiologist.

How is HIV transmitted?

HIV is spread when blood, semen or vaginal fluids from a person living with HIV who is not virally suppressed get into the bloodstream of another person. These body fluids explain why HIV can be passed from one person to another during different sexual behavior.

⇒ What can a person do not avoid getting HIV through sexual behavior?

There is no vaccine to prevent HIV but there are several ways a person can feel confident about avoiding HIV through sexual behavior. Practicing abstinence, that is, not having vaginal or anal intercourse, is one way to protect yourself from HIV. Cuddling, hugging, kissing (or) mutual masturbation have no risk of passing HIV from one partner to the other. Giving and receiving oral sex is considered a low-risk activity for HIV transmission.

8) How can a person get condoms to prevent?

A person can get condoms in a variety of ways. The following programme provide condoms free of charge. NYS condom access programme: the deposit of health free condoms available to eligible organizations which provides them to the public. for information about nearby organized visit: <http://www.health.ny.gov/diseases/aids/consumers/condoms/nyscondom.htm> (or) send an email to: [nyscondom@health.ny.gov](mailto:nyscondom@health.ny.gov).

9) What can a person do to avoid HIV through drug use?

people who use drugs should always use new needles, syringes, and works and avoid sharing them. if getting new equipment is not a possibility, people who inject drugs can lower the risk of HIV transmission by cleaning needles and works with bleach immediately after use and just before reuse.

10) How does HIV affect a person's health?

The signs and symptoms of early / acute HIV can begin 2 to 4 weeks after transmission occurs. with HIV. during the initial weeks after transmission about 50% of people will develop symptoms similar to the flu. this may include things like fever, fatigue, sore throat, headaches and swollen lymph nodes. although many of symptoms are similar, there are some differences to look for between HIV and the flu. early HIV may cause rash or mouth sores. flu signs that different nasal congestion, cough and sneezing.

11) Why is HIV testing important?  
Ans:-

12) How does HIV testing work?  
Ans:-

Most people who are living with HIV will have a reactive test, meaning the test found evidence of HIV within one month of transmission the period of time after transmission the period of time before the HIV test turns reactive is called the "window period." When transmission first occurs, the virus begins to reproduce and the body makes antibodies to fight HIV when enough virus is present or antibodies are developed, the HIV test will be reactive. Most people living with HIV will develop enough antibodies or have enough virus present to be detected by the latest testing technology two to four weeks after the exposure virtually all cases of HIV can be detected by three months after transmission occurs.

For a standard HIV test, a blood or oral fluid sample is taken and sent to a laboratory, you will need to call or come back about a week after the test to get your test result. At some clinics and doctor's offices, you can get a rapid HIV test, which can give you a preliminary result that day. The test takes about 20 minutes. If your rapid HIV test is result that day, the test HIV is reactive meaning HIV virus or antibodies were found, you will need additional testing that is sent to a laboratory.

124 What does it mean to have a negative test result?

ans:-

you do not have HIV you generally means a recent exposure you may be in the "window" period is the period of time between someone gets exposed to HIV and when the test is able to detect it. if the first result comes back negative and there is still concern, getting tested again 3 months after the last possible exposure can help to be sure. People who have a negative test result but would like to reduce the risk of HIV may want to consider Pre-Exposure Prophylaxis (PrEP). PrEP is a daily pill that people take so they can reduce their worry about acquiring HIV and keep HIV from entering your body.

you may want to consider taking it if you are.

\* A gay or bisexual man who has unprotected sex

\* A transgender woman who has sex with men

\* in a relationship with a person who is living with HIV

\* Someone who has condomless sex with multiple partners

\* A person who has been diagnosed with an STD in the past 6 months

\* People who have injected drugs in the past six months and shared needles or works.

134

What does it mean to have a test that results in an HIV diagnosis?

Ans:

if you have a test result that results in HIV diagnosis, you will receive post-test education about the meaning of the test result and the importance of health care. HIV treatment is effective, easy to take and has few or no side effects. The HIV testing provider will schedule an appointment for HIV care on the spot.

if you a person living with HIV it will be important to reduce the risk of passing the virus to others.

The HIV testing provider will talk to you about the importance of notifying partners of possible exposure to HIV and the importance of HIV. The provider will report known partners and spouses to the Department of Health. However, persons who are diagnosed with HIV can choose from the following options on how they would like to have their partners informed that they have been exposed to HIV.

\* People can tell their partners with the help of their healthcare provider or Pnap/CNAP counselor.

\* People can tell their partners themselves.

Help from Pnap/CNAP is free. For more information, call the New York State Department of Health HIV/AIDS Hotline (see the Resources section) in New York City, call CNAP at 1-212-693-1419.

Q) How does HIV affect a person's health?

The signs and symptoms of early acute HIV can begin 2 to 4 weeks after transmission occurs with HIV. During the initial weeks after transmission, about 50% of people will develop symptoms similar to the flu. This may include things like fever, fatigue, sore throat, headaches and swollen lymph nodes. Although many of symptoms are similar there are some differences to look for between HIV and the flu. Early HIV may cause rash or mouth sores.

Full signs that differ may be nasal congestion, cough and sneezing. Symptoms can last for just a few days or weeks, and in rare cases for several months. After that, person may feel and look fine for some time.

HIV testing is the only way to know if a person has HIV.

If HIV is left untreated, over time it will seriously damage the person's immune system and leave him or her open to life-threatening infections and even death. Early in the epidemic before our current treatments were available, most people living with HIV died within 12-15 years.

Today, once a person has a reactive (meaning the test found evidence of HIV) test result, he or she will be linked to a health care provider who will provide care and prescribe medication they need.

With treatment, people living with HIV can stay healthy and live fully. HIV is no longer a death sentence.

KRE SOCIETY'S

KARNATAK ARTS SCIENCE AND COMMERCE COLLEGE, BIDAR

Add-On-Course "Basics of HIV/ AIDS"

DEPARTMENT OF SOCIOLOGY (2020-2021)

REPORT

Name of the Course: Basics of HIV/ AIDS

Name of the Department: SOCIOLOGY

Name of the B.O.S: Dr.Srinivas Reddy (Asst. Prof)

Number of Students: 28

BOS Meeting Date: 05/02/2019

Start date of course: 01/02/2021

End date of course: 13/04/2021

Department of Sociology conducted Add-On-Course on "Basics of HIV/ AIDS" Study of this course helps to student's to understand that how much serious issue and Problem to our society now a day. This study assesses the knowledge the observations of this study will serve as a basic for further tailored approaches to strategic programs to control this problem. At the end of term we are conducting examination on study of Basics of HIV/AIDS declared the result.
